

Can you tell which glass of water has lead in it?

SAMPLE A

SAMPLE B

We Can.

And we can show you what to do about it.

The possibility of lead in drinking water is a potential health risk faced by millions of Americans whether they live in a new house or an older residence. It can come from the brass or chrome in new faucets or from old fixtures and pipes, particularly pre-1988 construction. For adults, high concentrations of lead can be related to: high blood pressure, stroke, kidney disease and cancer - in children, it can mean a lower IQ. Your first step to peace of mind is the Consumer Reports Water Test Service.

Just make one call ...

Our state-of-the-art water test offers a convenient and scientific method for determining the lead content of your water. Just call 1-800-840-0264 and we'll send you easy-to-use instructions and mail-safe water tubes. Take two samples of your water and return them in the pre-paid envelope to us.

... and put your mind at rest.

You'll receive a complete, easy-to-understand lead content report along with the Consumer Reports "Guide to Clean Water." It describes simple steps you can take to make your water safer from lead contamination. Don't wait. It's the most reliable way to keep yourself and your family safe from harm.
